TO

CHARLES HENRY WYNDHAM A'COURT REPINGTON, Esq.

*(The surviving Executor to the Right Honourable the  
Lord Herbert of Lea.)*

DEAR SIR,

It has been my privilege to analyze the accounts of twenty-three years' (1850 to 1873) experience of farming on the Wilton House Home Farm, near Salisbury, by Lord and Lady Herbert of Lea. As Professor of Estate Management I have lectured upon the history and results of the farm to the students of the Royal Agricultural College, Cirencester. The facts derived from the analysis thereof are so completely at variance with the opinions of land-owners, land-occupiers, land agents, and the agricultural community generally in respect to the Land Question, that I venture to make known the important facts as they occurred on the above farm. In so doing I wish most emphatically to remind my readers that I treat of *facts only*, and not estimates.

I have the honour to remain,

Your faithful and obedient servant,

THOMAS JOHN ELLIOT.

SOUTHWICK, FAREHAM, HANTS,

*July 1, 1884.*

## P R E F A C E.

---

THE work I now place before my readers has, in a great measure, formed the subject-matter of lectures delivered by me to the Students of the Royal Agricultural College at Cirencester. Through the kindness of the Earl of Pembroke in granting me permission to make use of the facts obtained from the accounts of the Wilton House Home Farm during a period of twenty-three years, and with the assistance of Mr. Wm. Robson, late Agent of the Pembroke Estates in England, who has throughout given me the benefit of his valuable experience, I have been able to examine and solve the Land Question in its bearings upon agriculture. The history of the farm, the system of management pursued, and all the *facts* derived therefrom are fully given, affording in their detail excellent matter for instruction to the student of agriculture.

No special merit is claimed for more than ordinary farming; there being in the kingdom a great many farms managed as well, and producing equal if not more profitable returns when compared with the one in question.

Farming is shown to have been a profitable occupation from 1850 up to and including 1873.

The quantities produced during the 23 years, with the gazetted prices for 1883 attached, show a profit; and the estimated quantities for 1884, with prices equal to the actual cost of production, also leave a profitable amount in favour of the farm.

If it is true that "what has been done" in the natural order of things "may be done again," then the results obtained

upon the Wilton House Home Farm ought to encourage the tenant-farmer of the present day.

There is, however, that little word "if" to be faced, and it says to both landlord and tenant: "If you use *sufficient* capital in farming, you *will* be able to compete with low prices, and stand safely against a series of bad seasons."

The common question, "Can corn be profitably grown in England at the present low prices?" is herewith answered in the affirmative. The only way to encourage capital to flow into agriculture is to prove that farming is a profitable occupation.

This is shown to be so in the case of the Wilton House Home Farm, and it is on this fact alone I claim that I have *solved*, so far as agriculture is concerned, "The Land Question."

With a judicious application of capital in farming, the old couplet, somewhat altered to the circumstances of the case, remains true, namely:—

"There's food, and no doubt on't,  
As much in the land  
As ever came out on't."

THOS. J. ELLIOT.

SOUTHWICK, FAREHAM, HANTS.  
1884.

FIRST SECTION OF ACCOUNTS.

FROM

MICHAELMAS, 1850, TO MICHAELMAS, 1870,

TOGETHER WITH 1871 TO 1873.

ALSO,

APPENDIX THERETO, AND CONCLUSIONS.

# THE LAND QUESTION.

## INTRODUCTION.

THE aim of this work is to show that cereals can be profitably grown in this country even when sold at low quotations in conjunction with the production of butchers' meat at the present range of prices. The farm, as to its position and the variety of its soils, may be taken as a type of one of an inferior class of farms on the vast estates in Wiltshire of George Robert Charles, thirteenth Earl of Pembroke, and tenth Earl of Montgomery. It was held with Wilton House Park and Demesne Grounds until Lord Herbert's death, afterwards by Lady Herbert of Lea until Michaelmas, 1873, and subsequently (but not recorded in these accounts). It adjoins the Park, and is situated between it and the Warren Woods (game coverts). It has a northern aspect, and occupies the face of a hill midway between the Water-meadows in the Valley at Wilton, and the Downs and Woods on the summit of the surrounding hills.

Which, on 201a. 0r. 11p., including the site of homestead, 2a. 1r. 27p., and the arable land, 198a. 2r. 24p., in cultivation, equals, per acre, £17 Ss. 1½d.; or otherwise, on 273a. 2r. 18p., the area of the farm, including downs and wastes, £12 15s. 10d.

The Hookland Arable consists of a rich loam resting on a chalky subsoil, and adjoins the water-meadows in the valley, which are about a mile and a half distant from the homestead; these soils average about nine inches in depth, and it may be worthy of remark that the yield in cereals on an average of years was equivalent to crops grown on soils twice and three times their depth. The roots grown were found to be deficient in quantity, but nevertheless nutritious.

The Field and Down Arable Land is a thin calcareous soil, wanting in texture or adhesiveness which can only be acquired through management in cultivation. The analysis showing the respective qualities of the soils, by Professor Lyon Playfair, in 1846, is given in the Appendix. The Farm was taken in hand at Michaelmas, 1846. About this period it was established that the land in this country, under the then existing system of cultivation, did not supply its fair and proportionate amount of food for the population, so that the abrogation of the Corn Laws followed as a consequence.

The Farm at that time was in a foul and poor condition. The ultimate objects for improving the land were fourfold, viz :—(1) To relieve the labour market in Wilton parish ; (2) to adjust in a more convenient and economical way the horse power engaged in the Park and Demesne grounds ; (3) with a view of showing the capability of the farm for increased productiveness ; and (4) to save the tenant further loss through game.

The crops (irrespective of the Hookland) previous to 1846 were estimated to have produced 18 or 20 bus. of wheat, 28 bus. of barley, and from 32 to 36 bus. of oats per acre. The averages from 1850 to 1870 were, however :—Wheat,  $32\frac{1}{2}$  bus. per acre ; barley, 46 bus. ; oats or dredge,  $57\frac{1}{2}$  bus. ; beans or pulse,  $37\frac{1}{4}$  bus.

The former estimates were confirmed by two professional valuers, the late Mr. Thomas Waters, of Stratford-sub-Castle, near Salisbury, and the late Mr. John Combes, of Tisbury, Wilts, both of whom knew the farm all their life-time. The rent of the farm was fixed by Mr. Robson, the agent of the Pembroke estates in England, at £300 per annum on the produce principle, which was adopted in letting farms on that estate, subject, nevertheless, to an allowance for manure purchased ; the hay, with the greater part of the straw, roots, and green crops grown being consumed on the farm. The operation of the scheme is shown in the Appendix. The rent was greatly in excess of the amount paid by the former tenant to the Earl of Pembroke. Mr. Robson directed the management of the farm, the details of which were ably carried out by the bailiff, Mr. Thomas Williams. The farm as formerly managed was scarcely equal to the maintenance of 150 ewes with the usual number of chilver or ewe lambs necessary to maintain such an ewe flock, the numbers kept between 1850 and 1870 being 312 ewes on the average of years, and this average was to be the number kept for stocking the farm during the following seven years at least. The remainder of the lambs, and the cull or sale ewes to be drafted off annually, according to the custom of the neighbourhood. This custom was not adopted during the twenty-three years of average on the farm in question, owing to the hilly nature of the ground, and the consequent wear and tear in drafting off the sheep flock from fold to fold. However, on the other farms of the estate it was considered the best form of management for the sheep flock. An additional plot or two of pasture-land would have improved the farm by providing a nursery for the sheep in adverse seasons, and also in assisting in bringing earlier to maturity the draught stock.

The cropping from 1846 to Michaelmas, 1850, was adapted to suit the convenience of the Demesne; but in consequence of the extreme poverty of the soil at Michaelmas, 1850, the land was farmed with the object of improving its fertility by increasing the productiveness of the Water-meadows, the Hookland Arable, and the Field and Down Arable. The farm proved useful as an auxiliary to the Demesne lands and the Park Dairy in maintaining three additional horses for the former, and in wintering the young stock reared for the latter. It must be remembered, however, that these additional horses assisted farming operations by affording extra strength during critical seasons. The mode of letting the farm on the produce principle was made use of by the Right Honourable Sydney Herbert, as a test in letting the farms on the Pembroke estates.\*

The course of cropping between 1850 and 1863, was that about two-thirds of the Hookland Arable, and two-fifths of the Field and Down Arable were in cereals.

Special plots, about thirteen acres in all (called "acres" on the map) adjacent to the Homesteading, were separately cultivated for roots and green forage, and about one-sixth in cereals. The roots and green food from these plots were carted to the buildings, and were consumed by the working horses and fattening beasts. It was ultimately intended, after having got the plots into condition, to cultivate them as market gardens, but this idea was abandoned in consequence of the farm being so much injured by game from the adjacent coverts.

The average of the entire period has been four-ninths of the area in cereals, and five-ninths in hay, root, and green crops. The accounts from Michaelmas, 1850, to 1873, have been minutely kept, and the results, which the following statements show, arise from a system of farming which may be taken as an exception to the prevailing husbandry of the neighbourhood, where the production of corn, and the rearing and sale of draft ewes and lambs is the practice, and fattening of stock the exception. The recapitulation of the first thirteen years' results shows that the infertility of the farm was overcome, the produce of cereals per acre and the quantity of meat produced during that period being equal to the average of the twenty-three years—viz., from 1850 to 1873 inclusive.

\* With its result he was in a position to advise his brother, Robert Henry, Earl of Pembroke and Montgomery, as to his future action consequent upon the changes effected in agriculture through the abrogation of the Corn Laws. He also interested himself, at his cost, in improving the estate by purchasing intermixed adjacent properties of vast importance to the estate. Further, I must add, he and his mother, Catherine, Countess of Pembroke and Montgomery, undertook to a great extent the duty of supplying the temporal and spiritual wants of the poor on the estate, showing thereby a kindness and forethought for those around them which has rarely been equalled.

RECAPITULATION OF PROFITS PER CENT. ON A  
CAPITAL OF £3,500,

*As shown in Schedules 1 and 2, folios 19, 21.*

	Amount.	Average per cent. on 23 years.
	£   s.   d.	£   s.   d.
Twenty years at £8 2s. 7d. per cent., from 1850 to 1870, as per folio 19	162 11 8	
Three years at £19 9s. 10d. per cent. for 1871-2-3, as per folio 21	58 9 6	
	221 1 2	... 9 12 2¼
Add increased amount in valuation of inventory as per folio 15, being the net accumulation of capital between 1850 and 1873, which, per annum, on the average of 23 years' equals	52 8 1¼	... 1 9 11¼
Total per-centage realised at prices for cereals, viz.: Wheat, 7s. 0¼d. per bus.; barley, 4s. 7¼d.; oats and dredge, 3s. 3¼d.; beans or pulse, 5s. 6½d.; and for hay, root and green crops, viz.: Mutton, 8¼d. per lb.; beef, 7¼d.; pork and bacon pigs, 5¾d.; poultry, 8d.; wool, 1s. 4½d.	...	... 11 2 1½

This return percentage was obtained through the amount of capital employed being sufficient. The products of the farm realised remunerative prices during a series of years, and the balance in favour thereof proves that the production of cereals and butchers' meat, when sold at the prices quoted, constitute profitable farming in this country.

We will show in the appendix which follows, the marginal rate at which the various agricultural products may be sold, so that a profit in farming may be secured.

In considering the conclusion arrived at, or rather defined, in the foregoing statements, it will be necessary to say that the results have

been obtained by the use of arable land and down pasturage, but without the aid of meadow or pasture lands (the fore share only of the Water-meadow being charged to feeding stuffs for sheep, and not as rent). Occasionally young stock were depastured in Wilton House Park, and the agistment price was invariably charged against the farm.

The foregoing statements represent in minute detail what has been accomplished in raising the fertility of the respective soils during the first thirteen years of a term of twenty. The cereals averaged per acre, viz.: Wheat,  $32\frac{2}{3}$  bus.; barley,  $49\frac{1}{5}$  bus.; oats,  $57\frac{1}{2}$  bus.; beans,  $35\frac{7}{8}$  bus.; and the averages for the twenty years were, respectively: Wheat,  $32\frac{1}{2}$  bus.; barley, 46 bus.; oats,  $57\frac{1}{2}$ ; beans,  $37\frac{1}{4}$  bus. The cost of production of the cereal crops in the thirteen years was £5 14s.  $7\frac{1}{4}$ d., and that for the twenty years £6 1s.  $4\frac{3}{4}$ d., nearly approximating each other. The ewe flock in the same period numbered 274, but between 1863 to 1870 an additional number of 38 increased the average to 312, being the number of ewes kept for the term of twenty years.

The produce of meat in the thirteen years, in quantities and price, was: Mutton,  $161\frac{1}{2}$  lbs. per acre at  $7\frac{1}{4}$ d.; beef, 81 lbs. at 7d.; swine, pork and bacon pigs,  $69\frac{3}{4}$  lbs. at  $5\frac{1}{2}$ ; poultry,  $5\frac{1}{4}$  lbs. at 8d. The produce for the term of twenty years, relatively, averaged: Mutton,  $155\frac{3}{4}$  lbs. per acre at  $8\frac{1}{4}$ d.; beef, 75 lbs. at  $7\frac{1}{4}$ d.; pork and bacon pigs,  $69\frac{1}{4}$  lbs. to  $5\frac{3}{4}$ d.; poultry,  $5\frac{1}{2}$  lbs. at 8d. The poultry statement, however, in the absence of detail, is somewhat incomplete. It will be observed that during the thirteen years feeding stuffs cost £6 0s. 9d. per acre, and the total cost of production was £12 17s.  $9\frac{1}{2}$ d., and that for the twenty years feeding stuffs cost £6 19s.  $1\frac{1}{2}$ d., and the total cost of production was £14 6s.  $2\frac{1}{2}$ d. The explanation of this is: the amount spent per annum in artificial food during the thirteen years was required in order to restore the land to a state of fertility; and, moreover, in the absence of pasture-land, and also to keep up the fertility of the soil, it was found necessary to spend £6 19s.  $1\frac{1}{2}$ d. per annum during the average of twenty years.

The effects of these sums being expended are elaborately shown in the appendix.

The receipts and payments of the thirteen years and the twenty-three years respectively, are epitomised and averaged for the sake of brevity, so as to give the most comprehensive view of the accounts generally, whilst a balance-sheet is given in the appendix, to which is added minute and detailed statements of the products arising from sheep, cattle, pigs, and poultry.

The farm has been held with the stipulation that the straw, hay, root, and green crops were to be consumed thereon. The receipts in respect of cereals and the amount for grain sold are shown in the balance sheet (fo. 16).

Only the best qualities of grain were sent to market, the remaining or inferior sorts grown on the farm being consumed by stock, and charged against the same at their relative marketable prices. In this instance it was found to be more profitable to reserve all inferior corn for home consumption rather than incur the expense of marketing the same. When this inferior corn is used as artificial food in conjunction with roots, &c., the tenant obtains a considerable addition to the manurial fertilisers of the farm.

Science affirms that the consumption of grain alone does not add to the fertility of the soil, but nevertheless its manurial value in conjunction with the consumption of the hay, root, and green crops on the farm, has materially aided the increased production of cereals and meat. On this farm the average of the three years to Michaelmas, 1873, of 36 bushels of wheat per acre, is equal to Sir J. B. Lawes' quotation in the *Morning Post*, October 12th, 1883, as produced by artificial manures only.

The results achieved on the farm in question do not bear out Sir J. B. Lawes' ideas as expressed in the following paragraph, viz. :—"I have more than once pointed out the fallacy which lies in the statement that the reduction in the price of an agricultural crop can be profitably met by an increase in the yield. This is not only not true, but it is the reverse of the truth."

## CEREALS.

Table showing Cost of Production per Acre and per Bushel. Also the amount Realised per Acre and per Bushel, with the Balances in favour of each respective Crop.

Description of Crop.	Cost of Production per Acre.		Quantities grown per Acre.	Price realised per Bush.	Amount realised per Acre.	Aggregate		Average	
	£ s. d.	£ s. d.				Profit.	Loss.	Profit.	Loss.
Wheat ...	6 4 1	3 9 <sup>3</sup> / <sub>4</sub>	Bush. 32 <sup>1</sup> / <sub>2</sub>	7 0 <sup>1</sup> / <sub>2</sub>	£ s. d. 11 8 2	£ s. d. 5 4 1	£ s. d. —	£ s. d. —	
Barley ...	5 10 7	2 4 <sup>1</sup> / <sub>2</sub>	46 <sup>1</sup> / <sub>2</sub>	4 7 <sup>1</sup> / <sub>2</sub>	10 11 9 <sup>1</sup> / <sub>2</sub>	5 1 2 <sup>1</sup> / <sub>2</sub>	—	—	
Oats or Dredge ...	5 4 2 <sup>1</sup> / <sub>2</sub>	1 9 <sup>1</sup> / <sub>2</sub>	57 <sup>1</sup> / <sub>2</sub>	3 3 <sup>1</sup> / <sub>2</sub>	9 8 1	4 3 10 <sup>1</sup> / <sub>2</sub>	—	—	
Beans or Pulse ...	6 16 6 <sup>3</sup> / <sub>4</sub>	3 4	37 <sup>1</sup> / <sub>2</sub>	5 6 <sup>1</sup> / <sub>2</sub>	10 6 5	3 10 1 <sup>1</sup> / <sub>2</sub>	—	—	
Rye ..	6 4 6	3 2	39 <sup>1</sup> / <sub>4</sub>	4 4	8 10 1	2 5 7	—	—	
Average ...	5 19 11 <sup>1</sup> / <sub>2</sub>	—	—	—	10 0 10 <sup>1</sup> / <sub>2</sub>	4 0 11 <sup>1</sup> / <sub>2</sub>	—	—	

N.B.—These Crops were mostly sold with a portion of the Straw, the remaining portion being consumed on the Farm. (For result see Folio 17.)

The importance of the above Tables will be more readily appreciated by observing that a Bushel of Wheat costs 3s. 9<sup>3</sup>/<sub>4</sub>d.; a Bushel of Barley 2s. 4<sup>1</sup>/<sub>2</sub>d., a Bushel of Oats or Dredge 1s. 9<sup>1</sup>/<sub>2</sub>d., a Bushel of Beans 3s. 4d., and a Bushel of Rye 3s. 2d., to produce. Should there be no loss on the conversion of the Hay Roots and Green Crops into Butchers' Meat, the Cereal Crops may be sold at a profit if they realise any sum above the following prices per quarter:

Wheat, 30s. 6d.; Barley, 19s. 2d.; Oats, 11s. 6d.; Beans, 26s. 8d.; Rye, 25s. 4d.

CEREALS.

*Analysis of the following prices per bushel and per quarter realised on the respective cereal crops grown on an average of twenty years, viz. : Wheat, 7s. 0½d.; barley, 4s. 7¾d. ; oats or dredge, 3s. 3¼d. ; beans, 5s. 6½d.*

The loss shown in synopsis, folio 18, being £2 18s. 8d. per acre, or £322 12s. 2¾d. per annum in the conversion of hay, root, and green crops into meat, it therefore follows that the cost price of the cereal crops per bushel is increased respectively thus :—

	£	s.	d.
Wheat ... ..	302	16	1¾
Barley ... ..	290	5	5
Oats and Dredge ... ..	239	19	1
Beans and Pulse ... ..	103	2	9
Straw ... ..	33	18	1¾

970 1 9½

	£	s.	d.
If £970 1s. 9½d. gives £322 12s. 2¾d., what will £302 16s. 4¾d. give? ...	100	15	5¾
If £970 1s. 9½d. gives £322 12s. 2¾d., what will £290 5s. 5d. give? ...	96	9	0¼
If £970 1s. 9½d. gives £322 12s. 2¾d., what will £239 19s. 1d. give? ...	79	16	5
If £970 1s. 9½d. gives £322 12s. 2¾d., what will £103 2s. 9d. give? ...	34	5	1¾
If £970 1s. 9½d. gives £322 12s. 2¾d., what will £33 18s. 1½d. give? ...	11	6	2

£322 12 2¾

The synopsis shown in folio 18 becomes transposed thus :—

Wheat ... ..	£100 15s. 5½d. ÷ 860½ = 2s. 4d.	} Ratio of loss per bushel on the conversion of the Hay, Root, and Green Crops.
Barley ... ..	£96 9s. 0¼d. ÷ 1,259½ = 1s. 6¼d.	
Oats and Dredge ... ..	£79 16s. 5d. ÷ 1,468 = 1s. 1d.	
Beans and Pulse ... ..	£34 5s. 1¾d. ÷ 371½ = 1s. 10d.

## CEREALS—RECAPITULATION OF ANALYSIS,

AS SHOWN IN FOLIOS 27, 28.

*Tabula previous to the Adjustment of Loss by Conversion of Hay, Root, and Green Crops into Meat (as was the case between 1850 and 1870) showing the Cost Price of the Cereal Crop per Bushel and per Quarter, varying according to the Quantities Produced per Acre on Average Yields.*

	1850.		Intervening.		1850-1870.		1871-2-3.	
	Bus.	Qrs.	Bus.	Qrs.	Bus.	Qrs.	Bus.	Qrs.
Wheat, quantity grown per Acre	20	2½	23	3½	32½	4	36	4½
Market Price required to be realised per bushel and per quarter	9/11¾	79/10	7/1½	50/10	6/1¾	49/2	5/6½	44/4
Barley, quantity grown per Acre	28	3½	37	4½	46	5¾	50	6¼
Market Price required to be realised per bushel and per quarter	6/5¼	51/6	4/10½	39/-	3/11	31/4	3/7¼	28/10
Oats or Dredge, quantity grown per Acre	31	4¼	47	5¾	57½	7¼	61	7¾
Market Price required to be realised per bushel and per quarter	4/11	39/4	3/6½	28/4	2/10¾	23/2	2/8¾	21/10
Beans or Pulse, quantity grown per Acre	24	3	31	3¾	37¼	4½	41	5¼
Market Price required to be realised per bushel and per quarter	8/-	61/-	6/2½	49/8	5/2	41/4	4/8¼	37/6

## EXAMPLE.

For instance, in respect of the Farm in question as relating to Wheat. The yield in 1850 was 20 bushels per acre, and the consequent price shown in the Tabula is 9s. 11¾d. per bushel, and 79s. 10d. per quarter. The average of the 20 years' yield was 32½, and the price 6s. 1¾d. and 49s. 2d., and the last three years, 36 bushels, and the price 5s. 6½d. and 44s. 4d. The other respective crops may be so interpreted. This proves that increased production to a certain limit (Sir J. B. Lawes' results at Rothamsted) is the principle of progress to be relied upon for securing the interest of landlord, tenant, and consumer.

## CEREALS.—RECAPITULATION OF ANALYSIS (continued).

*Tabula* subsequent to the adjustment of loss by conversion of Hay, Root, and Green Crops into Meat (as was the case between 1850 and 1870), showing the cost price of the Cereal Crop per bushel and per quarter, varying according to the quantities produced per acre on average yields.

	1850.		Intervening.		1850-1870.		1871, 72, & 73.		Extra.	
	Bushels.	Qrs.	Bushels.	Qrs.	Bush. & qrs.	Qrs.	Bushels.	Qrs.	Bushels.	Qrs.
Wheat, quantity grown per acre ...	20	2½	28	3½	32½	4½	36	4½	40	5

Barley, quantity grown per acre ...	28	3½	37	4½	46	5¾	50	6½	54	6¾
Market price required to be realised per bushel and per quarter ...	5 0¾	40 6	3 10	30 8	3 1	24 8	2 10	22 8	2 7	20 8
Oats and Dredge, quantity grown per acre ...	34	4½	17	5½	57½	7½	61	7½	65	8½
Market price required to be realised per bushel and per quarter ...	3 8½	29 8	2 7½	21/-	2 2½	17 6	2 0¾	16 6	1 11½	15 6
Beans and Pulse, quantity grown per acre ...	24	3	31	3¾	37¼	4½	41	5½	45	5½
Market price required to be realised per bushel and per quarter ...	5 9	46/-	4 5½	35 8	3 8½	29 8	3 4½	27 -	3 0¾	24 6

EXAMPLE.—For instance, in respect of the farm in question as relating to Wheat. The yield in 1850 was 20 bushels per acre, and the consequent price shown in the above *tabula* is 7s. 7½d. per bushel and 60s. 10d. per quarter; the average of the twenty years' yield was 32½ bushels, and the price 4s. 8½d. per bushel and 37s. 6d. per quarter, and the last three years' yield was 36 bushels and the price 4s. 2½d. per bushel and 33s. 8d. per quarter. The other respective crops may be so interpreted. This proves that increased production to a certain limit (Sir J. B. Lawes' results at Rothamsted) is the principle to be relied upon for securing the interest of landlord, tenant, and consumer. But should the ratio per acre be raised from Sir J. B. Lawes' estimated average of the country, viz., 28 bushels to 40, the prices for Wheat would be 3s. 9¾d. per bushel and 30s. 6d. per quarter.

## MEAT PRODUCTIONS.

Analysis of the following prices per lb. on the aggregate, and also specifically, on the various kinds of meat produced. These are shown to have realised on the average of twenty years, relatively : Mutton, 8½d.; beef, 7½d.; swine, 5¾d.; poultry, 8d.; and wool, 1s. 4½d. per lb. (See explanations, folio 23).

On the aggregate the quantity of meat produced as given in synopsis, folio 18, averages 305½ lbs. per acre.

	s.	d.
And the average price realised for sales per lb., including tenant's profit of 10 per cent. on £17 Ss. 1½d. being 1½d. per lb. ... ..	0	7½
The cost of production also shown, folio 18, stands at £14 6s. 2½d.; therefore, if 305½ lbs. cost £14 6s. 2½d., what will 1 lb. cost, viz. : ... ..	0	11
Consequent loss per lb. ... ..	0	3¾
Made up thus loss in converting hay, root, and green crops into meat, as shown in appendix, folio 34, ... ..		2½d.
Net remaining loss not realised in sales between 1850 and 1870) ... ..		1½d.
	0	3¾

Average amount of wool realised on 1 lb. of mutton ... ..	0	1½
		9½
Loss in converting hay, root, and green crops into meat ... ..	0	2½
	0	11¾
Amount realised above cost price on the aggregate, as shown above (mutton) ... ..	0	0¾
	0	11

## BEEF.

Price realised, 1850 to 1870, including tenant's interest of 10 per cent. on £17 8s. 1½d. capital ... ..	0	7½
Loss in converting hay, root, and green crops into meat	2¼d.	
Additional loss not realised in cost price between 1850 and 1870 ... ..	1½d.	
	—	0 3¾
Aggregate cost per lb. ... ..	0	11

## SWINE.

Price realised 1850 to 1870, including tenant's interest, 10 per cent. on £17 8s. 1½d. capital ... ..	0	5¾
Loss in converting hay, root, and green crops into meat	2¼d.	
Additional loss not realised in cost price between 1850 and 1870 ... ..	3d.	
	—	0 5¼
Aggregate cost per lb. ... ..	0	11

## POULTRY.

Price realised 1850 to 1870, including tenant's interest, 10 per cent. on £17 8s. 1½d. capital ... ..	0	8
Loss in converting hay, root, and green crops into meat	2¼d.	
Additional loss not realised in cost price between 1850 and 1870 ... ..	¾d.	
	—	0 3
Aggregate cost per lb. ... ..	0	11

This result, however, is incorrect through the details of the account being incomplete, and the realised price would be more correctly stated at 1s. to 1s. 3d.

The loss shown in synopsis, folio 18, being £2 18s. 8d. per acre, or £322 12s. 2¾d. per annum in the conversion of hay, root, and green crops into meat, the average price being 7¼d. per lb., and the cost price shown in the foregoing analysis being 11d., it therefore follows that the cost price is 3¾d. per lb. in excess of the relative prices realised, and consequently the synopsis shown in folio 18 becomes transposed, thus:—

	£	s.	d.
Meat ... ..	1,048	3	3½
Wool ... ..	98	8	5¾
Hay, root, and green crops sold ... ..	64	19	10¼
Ditto consumed by working-horses ... ..	29	15	10
	<u>1,241</u>	<u>7</u>	<u>5½</u>

	£	s.	d.
If £1,241 7s. 5½d. gives £322 12s. 2¾d., what will £1,048 3s. 3½d. give? ... ..	272	7	11¾
If £1,241 7s. 5½d. gives £322 12s. 2¾d., what will £98 8s. 5¾d. give? ... ..	25	11	6¾
If £1,241 7s. 5½d. gives £322 12s. 2¾d., what will £64 19s. 10¼d. give? ... ..	16	17	9½
If £1,241 7s. 5½d. gives £322 12s. 2¾d., what will £29 15s. 10d. give? ... ..	7	14	10
	<u>322</u>	<u>12</u>	<u>2</u>

£272 7s. 11¾d. ÷ 33,675½ lbs. = 2¼d. per lb. in addition to the prices realised.

£25 11s. 6¾d ÷ 1,119¼ lbs. = 4¼d. + 1s. 4½d. (wool) = 1s. 8¾d.

Hence, the synopsis shown in folio 18 becomes transposed, as shown in the six diagrams, folios 55 to 61.

REMARK.—The Home Farm being allowed £27 per annum for manure, the expenditure being £81 per annum, it follows that the tenantry claiming the relative rates of allowance in respect of their holdings, must have spent in manure upwards of £300 per annum, to enable them to assert their claim to an allowance of every £100 from the Earl of Pembroke.

This vast expenditure represents the guaranteed security, contemplated in the Produce Scheme, for the maintenance of condition, or increased fertility of the estate. The above valuations are tithe free (tenant paying rates).

N.B.—Each valuation is irrespective of damage by game; nevertheless, the farm was surrounded by coverts strictly preserved with a large stock of game. The detailed results thus shown exhibit the comparative fairness of the Produce Scheme in contrast with the above valuations. Moreover, the rounded prices obtained in sales from the farm testify to the superior qualities of grain respectively produced, which were acknowledged to be the best samples shown in Salisbury market, though grown upon soils proverbial for their infertility.

## CONCLUSIONS TO FIRST SECTION OF ACCOUNTS.

The farm under the circumstances related and explained in the first section of accounts by high farming, with a capital of £3,500, was held profitably from Michaelmas, 1850, to Michaelmas, 1873, and yielded £11 2s. 1½d. per cent. on the capital employed. The range of prices realised for cereals being, viz.: Wheat, 7s. 0¼d. per bushel; barley, 4s. 7¼d.; oats or dredge, 3s. 3¼d.; beans or pulse, 5s. 6½d. The products for meat being: Mutton, 8¼d. per lb.; beef, 7¼d.; swine, 5¾d.; and poultry (nominally), 8d.

The rent of the farm was fixed at £300 per annum (and it is contended to be a fair one, inasmuch as it is the amount remaining from the sale of the products after deducting every other expense). It was converted into produce on a scale of prices equal to those obtained in 1835, viz.: Wheat, 7s.; barley, 4s.; oats, 2s. 9d.; meat, 6d. per lb.; and wool, 1s. Nevertheless, the rent was to vary with the prices for produce as adopted in the Earl of Pembroke's scheme for letting his estate. The quantities chosen were, two-fifths meat, one-fifth barley, and two-fifths wheat. The respective quantities being calculated at 6d. per lb. for meat, 3s. 6d. per bushel for barley, and 6s. for wheat, being the estimate formed by Lord Herbert and Sir Robert Peel as prices for agricultural products in the future, mutton, lamb, veal, beef, and pork, to be taken from the average prices published weekly in the *Mark Lane Express*, and the cereals being determined by those which regulate the tithe commutation rent-charges for England and Wales. At the end of the twenty-three years—1850 to 1873—the balance was 10s. per cent. in favour of the tenantry on the Pembroke estates, the prices then being 6½d. per lb. for meat, 4s. 4d. per bushel for barley, and 6s. 6¼d. per bushel for wheat.

As regards rent it will be evident that putting the fixed rent at the old standard prices into quantities of produce at a lower ratio, an apparent advantage is afforded to the landlord, but this difference was cancelled by an annual allowance of 10 per cent. for manures purchased (provided the tenant spent three times as much), the same not arising from the produce of the holding. This incentive operated in promoting an increased production, as exemplified by the result on the farm in question. An allowance of say £3,500 per annum by the landlord at this rate on an estate under such circumstances, would occasion £10,500 to be spent by the tenantry in manures, thus affording a guarantee for increased pro-

duction, and consequently an improved condition of the estate. During the twenty years of average, the 88 acres, 2 roods, 24 perches, of cereals grown per annum yielded a profit of £4 17s. 5½d. per acre, and the 110 acres of hay, root, and green crops, occasioned a loss of £2 18s. 8d. per acre, being 2¼d. per lb. on the total quantity of meat produced, and the consequent loss could only be redeemed by charging the cereal crop with 1s. 8d. per bushel on the total quantity produced. Under such results the comparative standard prices for rent, and those realised were, for cereals, viz. :

	Wheat.	Barley.	Oats.	Dredge.	Beans or Pulse.
1836 to 1850 ... ..	7.-	4.-	2 9	—	—
Prices realised, 1850 to 1870, on the Farm in question ... ..	7 0¼	4/7¼	—	3/3¼	5 6½

## MEAT PRODUCTION.

	Mutton.	Beef.	Swine.	Poultry.	Wool.
Standard 1850 ... ..	—	—	6	—	—
1850 to 1870 on the aggregate on the Farm in question ... ..	—	—	7¼	—	—
Price realised as shown (Folio 18) ... ..	8¼	7¼	5¾	8	1 4½
Cost price on realised quantities on the Farm in question, interest on Capital included ... ..	10¼	9¼	7¾	10	1 8¾

The inference from the foregoing is, that during the years of protection by Acts of Parliament, the realised prices for cereals on the farm in question for twenty years exceeded the standard, and more than covered the loss incurred in the production of meat (as shown in diagram, folio 19). The realised price of meat, however, was below its cost price, as shown in the accounts of the Home Farm. Moreover, these deductions, though not applicable to all cases in the kingdom, tend to dispel the notion that because a standard of prices may have been arrived at and acted upon for half a century, it does not follow that they are relatively correct. In addition, the facts derived from the foregoing accounts prove the correctness of the old rule that to grow cereals profitably you must produce meat and manure; and they suggest that the average yield of cereals in this country (which for the crop of 1884 is estimated at: Wheat, 28½th bushels; barley, 37¼th; oats, 47¾th; and beans, 31¼th)

is capable of being increased in ratio to the achievements of the farm in question, as well as to the results obtained by Sir J. B. Lawes in his experiments at Rothamsted.

Although the farm has passed through the vicissitudes of twenty-three seasons, yet it is acknowledged that a consecutive series of bad seasons, with disease in stock, call for special considerations, which are not included in the analysis thus rendered.

WILTON HOUSE HOME FARM.

SECOND SECTION OF ACCOUNTS.

FROM

MICHAELMAS, 1873, TO MICHAELMAS, 1883,

SHOWING

*Fall in Value of Cereals and Rise in Prices in the Production of  
Meat, and the consequent Results applied to the circumstances of  
the Farm in question in the Transposition of Prices.*

It may be affirmed that the circumstances occurring between 1850 and 1873 are not applicable to those existing between 1874 and 1883. The following estimates by implication (the farm account being discontinued in 1873) are based upon the average products of the twenty-three years (1850 and 1873), and have been estimated upon the assumption as regards cereals, that the quantities grown at 1873 could be maintained at the preceding cost of production up to and including 1883; also, that the prices gazetted between the two periods may fairly be stated to be equal to those realised in the future. The cereals from 1873 are relatively increased four bushels an acre, upon the belief that the fertility attained in 1873 could be maintained during the following years of average by economy in feeding, and perhaps by the curtailment of the ewe flock. As regards the hay, root, and green crops, it was intended that the ewe flock, with the number of beasts and swine kept, should remain stationary in number as between 1850 and 1873, but the prices for their relative products are quoted as it is believed they have existed in the same period of time, viz., from 1874 to 1883. The following diagrams show the results which would have arisen on the farm in question between 1874 and 1883 (both inclusive) under a similar condition of husbandry, and with an equal amount for collateral claims allowed, in addition to the cash per-centages shown in the account.

## DEFINITIONS OF PRECEDING DIAGRAMS.

Diagram No. 1 shows the products of twenty years' averages (1850 to 1870) at the average Gazetted prices for Cereals; from 1873 to 1883 with prices for Meat; for 1874 at the preceding twenty-three years' averages.

Diagram No. 2 is estimated on the produce in quantities of 1850 to 1873, at Gazetted prices for Cereals between 1873 and 1883, and at the estimated prices for Meat for 1874.

The result of Diagrams 1, 2, and 3, as stated below, may be assumed to have been the result had the farm in question been kept up from 1873 to 1883, viz., Diagram No. 1, £10 9s. 0¼d.; Diagram No. 2, £15 2s. 4¾d.; Diagram No. 3, £8 13s. 9¼d. The whole (including game damages) averaging £11 8s. 4¾d.

Diagram No. 3 shows the extent of the fall in value in Cereals for the years of average, and the increase in the rise in prices for Meat, which it will be necessary to obtain in the future, and which is proved in the following transposition of affairs. It must, however, be borne in mind that the three years' averages could only have been maintained by the use of ample capital.

## DEFINITIONS OF PRECEDING DIAGRAMS.

Diagram No. 1 shows the products of twenty years' averages (1850 to 1870) at the average Gazetted prices for Cereals: from 1873 to 1883 with prices for Meat; for 1874 at the preceding twenty-three years' averages.

Diagram No. 2 is estimated on the produce in quantities of 1850 to 1873, at Gazetted prices for Cereals between 1873 and 1883, and at the estimated prices for Meat for 1874.

The result of Diagrams 1, 2, and 3, as stated below, may be assumed to have been the result had the farm in question been kept up from 1873 to 1883, viz., Diagram No. 1, £10 9s. 0¼d.; Diagram No. 2, £15 2s. 4¼d.; Diagram No. 3, £8 13s. 9¼d. The whole (including game damages) averaging £11 8s. 4¼d.

Diagram No. 3 shows the extent of the fall in value in Cereals for the years of average, and the increase in the rise in prices for Meat, which it will be necessary to obtain in the future, and which is proved in the following transposition of affairs. It must, however, be borne in mind that the three years' averages could only have been maintained by the use of ample capital.

PROOF ANALYSIS AND TRANSDITION OF ACCOUNTS

(Consequent upon the fall in the prices for Cereals in 1883) from the averages of 1850 to 1870 to the results to which they are equivalent, showing that in future the consumer may have to pay less for Bread and Flour and more for Meat if the transposition prices prevail.

N.B.—The average of the above diagrams is £14 9s. 11¼d.

COMPARATIVE PER-CENTAGES OBTAINED IN FARMING  
THE WILTON HOUSE HOME FARM WITH A CAPITAL  
OF £3,500, EMPLOYED VIZ. :—

	£	s.	d.
The first section of accounts is a statement of facts as they occurred between 1850 and 1873; the details are recorded in folio 22, and show under the circumstances to have produced a per-centage of ... ..	11	2	1½
The accounts of the farm as they had previously been kept were discontinued at Michaelmas, 1873; but assuming that the yield of the farm between 1850 and 1873 could have been maintained between 1873 and 1883, it follows that the quantities of produce obtained in the twenty-three years, if sold at the gazetted prices for cereals, and the market prices were obtained for the quality of meat produced on the farm for the same period, would show a per-centage of profit equal to ...	9	0	9¼
But taking the relative products at cost prices, including interest on capital employed, as might have occurred between 1873 and 1883, it is shown, folio 61, that the amount of profit would be, per cent. ... ..	14	9	11¾

It thus follows that in considering the circumstances of the farm in question the last per-centage of profits recorded are preferable to the former, as proved in the analysis. The result, however, is at variance with public opinion as to the future of the land question in this kingdom, which is thus shown to depend upon the amount of capital that can be brought to bear in developing the resources of the land. The analysis proves that the farm was farmed profitably during the first section, and through the influence of increased production would have held its own during the second section up to the transposition of prices for produce in 1883 and subsequently. The analysis of the third section of accounts is in effect a paradox, as it will be borne in mind that every pound of meat made on 198 acres, 2 roods, 24 perches of arable land with only the aid of a sheep-down, was produced at a loss of 2¼d. on the prices realised in the twenty-three years; but, nevertheless, the loss on every pound produced in the aggregate was 3¾d., as shown in folio 32; but, moreover, through the transposition of prices the six diagrams, folio 55, give the profitable sale prices, including interest on capital, viz.: Mutton, 10¼d.;

beef, 9½d.; swine, 7¾d.; poultry, 10d. (per carcase sinking offal), and with prices for meat at this ratio the said diagrams prove that cereals may be grown profitably in this kingdom, even when sold at low prices.

These facts, however, are admitted to be at variance with public opinion, but they nevertheless are true. Moreover, it is admitted that they might have been produced at less cost than has been shown had a more skilful direction of operations on the Wilton House Home Farm been observed. The aim in cultivation was intended to be synonymous with that on the Kingston Lacey Estate, in the parish of Shapwick, in the county of Dorset, which on an extensive scale was carried out by the late Mr. Martin Small, who was the pioneer of good farming, not only in that district, but through the length and breadth of the kingdom. He broke up down-pasture land and exhausted old lays (valued by a committee of farmers at below five shillings an acre), still he never allowed the virgin fertility of the areas broken up to be diminished. Between the years 1836 and 1884 he maintained the increased productiveness of his farm, and harvested one of his finest crops in 1883, the crops on the newly broken-up "uplands" being equal to former yields on the best soils of the farm. On a large part of his holding he succeeded bankrupt tenants, who surrendered to him lands in a foul and exhausted condition; but, nevertheless, he ended his career as an exemplary agriculturist, benefiting not only himself, but his landlord's estate, through profitable farming. Should the present management of the Home Farm, as regards the course of cropping and the amount of stock kept, be shown to be identical with that so successfully preceding it, the results enumerated in the dissection will be borne out. But let us assume an alteration in the course of management, and the produce scheme done away with, it will be necessary to further illustrate its action, and perhaps this can best be effected through assuming that Lord Herbert of Lea, by putting the rent of the farm on the produce principle, placed himself in the dual position of landlord and tenant; and by expending three times the amount in manure and feeding stuffs, he was justified in claiming 10 per cent. on the pivot rent (£27 per annum). It might, however, appear as if he were paying it to himself, and thus reduced the rent which he would have paid had he not been entitled to an allowance for manure. But supposing in 1873 he had renewed his engagement to hold the farm for another term of twenty years, and not to have spent the required amount in manure and feeding stuffs. To the detriment of the farm the rent would be increased by the amount of his lessened expenditure, so that at the end of the second term he would

have increased his rent, and, as it were, exhausted the benefit arising from the £27 per annum, which he obtained for manure in the first term of his holding.

Again, suppose he surrendered his second term by giving up the farm in its normal condition, he as tenant under the circumstances, would in effect forfeit the advantage which the allowance for manure and feeding stuffs afforded him, and thus, as it were, pay the landlord compensation for his loss in fertility to the extent of the manure clause. The design of the produce scheme for rents, with its allowance for manure and feeding stuffs contemplated this result, and was proposed as a guarantee to the landlord for, and an encouragement to, the tenant in maintaining increased productiveness, as exemplified on the Wilton House Home Farm in 1873, and on Mr. Martin Small's extensive holding at Shapwick in 1883.

WILTON HOUSE HOME FARM.

---

EXPOSITION

TO

FIRST SECTION OF ACCOUNTS,

FROM

MICHAELMAS, 1850, TO MICHAELMAS, 1873,

TOGETHER WITH ITS

*APPENDIX AND CONCLUSIONS.*

## EXPOSITION OF RECEIPTS AND PAYMENTS,

*As shown in the preceding balance sheets, and in the synopsis, folio 16.*

The preceding accounts, showing the averages of twenty-three years, are statements of facts, and not estimates.

The receipts in respect of cereals are made up by the amount for grain sold, as shown in the balance sheet (folio 16), with the quantities consumed on the farm at their relative market prices. The grain consumed by stock increased the manurial value of the hay, root, and green crops feed on the farm. The average area in cereals grown annually has been 88 acres, 2 roods, and 24 perches (or four-ninths of the area cropped per annum).

The straw arising from the same is computed from the average of the thirteen years, which is taken as a criterion for the twenty-three, and is as follows, viz. :

a.	r.	p.		Per Acre.			Total.		
				Tons.	cwt.	qr.	Tons.	cwt.	qr.
26	1	10	Wheat ... ..	1	16	2 $\frac{1}{4}$	48	2	0 $\frac{1}{2}$
26	3	20	Barley ... ..	1	6	1	35	5	1 $\frac{3}{4}$
25	1	36	Oats or Dredge ... ..	1	11	3 $\frac{1}{2}$	40	13	1 $\frac{1}{4}$
9	3	38	Beans or Pulse ... ..	1	13	1 $\frac{1}{4}$	16	12	2 $\frac{1}{2}$
88	2	24		6	8	0	140	13	2

These quantities, priced at their relative values, stand thus :

	Tons. cwt. qr.			Price per Ton.			£ s. d.		
	£	s.	d.	£	s.	d.	£	s.	d.
Wheat ... ..	48	2	0 $\frac{1}{2}$	1	10	0	72	3	0 $\frac{1}{2}$
Barley ... ..	35	5	1 $\frac{3}{4}$	2	0	0	70	10	11
Oats and Dredge... ..	40	13	1 $\frac{1}{4}$	2	0	0	81	6	7 $\frac{1}{2}$
Beans or Pulse ... ..	16	12	2 $\frac{1}{2}$	1	0	0	16	12	8
Total value of Straw per annum ... ..							£240	13	3

## HAY.

Hay consumed with root and green crops, viz. :

	£	s.	d.
By sheep, 5 cwt., 3 qrs., 6 lbs., at £2 10s. per ton, 14s. 6 $\frac{1}{4}$ d. per acre, or on 110 acres per annum ... ..	79	17	3 $\frac{1}{2}$
By cattle, 1 cwt., 2 qrs., 19 lbs., at £2 10s. per ton, 4s. 2 $\frac{1}{4}$ d. per acre, or per annum on 110 acres ... ..	23	0	7 $\frac{1}{2}$
			102 17 11
Amount being per acre on the area of the farm, £1 14s. 7d. ... ..			343 11 2

This amount forms no part of the financial account, but indicates the value of the tenant's property in connection with 110 acres of hay, root,

and green crops, contracted by agreement, to be spent on the farm, and thereby utilised in adding to its fertility; but nevertheless it must be borne in mind that the hay, root, and green crops could not be converted into meat without the aid of these productions, and therefore this item cannot be said to have been used exclusively for the benefit of the landlord.

The amount received for hire of horses and implements is the balance remaining as interest on capital and tenant's profit after deducting charges made on the demesne account. (See appendix, 131).

---

## ANALYSIS OF EXPENDITURE IN RESPECT OF FARM,

*As shown in general balance sheet, folio 16.*

### MANUAL LABOUR, £2 5s. 9d. PER ACRE.

This item shows the aggregate amount spent per acre in the cost of producing the crops, as exemplified in folio 16, but is exclusive of the bailiff's salary, which in this instance is considered to be defrayed out of the farming profits of the tenant, and also is exclusive of the weekly rents of four cottages, which are allowed in the wages of the carter, shepherd, and herdsmen stationed near the homestead, the amount considered for each cottage being equivalent to 4d. or 6d. per acre.

### ARTIFICIAL MANURES, 12s. 0½d.

This item is spread over the area of the arable land, as its application could not be separately distinguished in the production of the respective crops grown. It will, however, be observed that the amount applied to the root and cereal crops has only been such as to promote early vegetation, the fully developed crop being secured by increased fertility in the soil.

### SEEDS PURCHASED AND THOSE OF HOME GROWTH IS 13s. 7d.

This average is obtained from their marketable values.

### HORSE CORN AND FORAGE, £1 0s. 10½d.

This is considered the only annual expense against horses, the depreciation of horse-flesh being accounted for in the respective inventories, valued by Messrs. Coombes and Son; harness, &c., being classed as implements.

## BAILIFF'S MARKET AND FAIR EXPENSES, 2s. 2¼d.,

including commission on the sale of lambs in London, are those incurred by the bailiff, irrespective of his own maintenance.

COST AND WEAR AND TEAR OF IMPLEMENTS AND HURDLES, 6s. 2¾d., includes the farm portion as well as for hire, three extra horses being kept for this purpose. The implements used were sufficient for double the area of the farm. Therefore, the price per acre may be assumed to be higher than was absolutely necessary. The sum received from the demesne for hire of horses and implements may be considered as an equivalent, in lieu of interest for farming capital and tenant's profit employed in this department.

## THE ITEMS FOR SUNDRIES AND BAD DEBTS

are shown as they were incurred, 3s. 9¼d.

## FEEDING STUFFS, £3 17s. 0½d. PER ACRE ON AREA OF ARABLE.

The cost, £6 19s. 1½d. per acre on the area of the hay, root, and green crops, is apparently high, but this may in part be attributable to there being no pasture-land, except inferior sheep downs, attached to the farm, and the amount paid for agistment in the park being designedly small. The foreshare of the Water-meadow was charged separately to sheep under that heading. A question, however, arises as to the policy of keeping so large an ewe flock, and whether, with better management and less cost, the hay, root, and green crops could not have been converted into meat more profitably.

## RENT, RATES AND TAXES, £1 10s. 3d.

The farm in question being situated in three parishes, and the parochial rates and tithe rent charges being also divergent, the rent of £1 10s. 3d. was adopted, supposing the farm to be extra parochial with a view of arriving at a result, which would be analogous to other parts of the Wilton House estate, of which the farm in question is considered a type. It was also used as a test to show the effect produced upon rents by the abrogation of the Corn Laws, and the consequent introduction of free trade into this country. That being the case, it will be necessary to show how this rent is analogous to the letting of other farms on the estate, which are let subject to the tenant defraying parochial rates and tithe rent charges; hence the £1 10s. 3d. should be sub-divided thus, viz.:

	£	s.	d.
The poor, church, and highway rates (averaging 3s. 4d. in the pound on the rateable value); the proportion charged for parochial rates in the assessment of the county of Wilts ... ..	0	5	0
Tithe rent charges (tithe owners paying rates thereon) ...	0	6	0
	0	11	0
Rent payable to landlords, the tenant finding straw for thatched buildings, and being allowed a moiety of the cost of workmanship incurred thereby, the tenant also being compelled to consume by stock all hay, root, and green crops and straw on the farm ... ..	0	19	3
	1	10	3

The parochial rates and tithe rent charge being payable by the tenant, the 19s. 3d. would be due to the landlord subject to deductions, as stated below. The 19s. 3d. would, however, depend upon the average prices of meat, barley, and wheat, in accordance with the produce principle of letting farms on the Wilton House estate, and their equivalents would stand thus, viz. :—

RENT PAYABLE TO LANDLORD, 19s. 3d.

	s.	d.		£	s.	d.
$\frac{2}{3}$ th meat, $15\frac{2}{3}$ th lbs. at 6d. = 7 $8\frac{2}{3}$ at 0s. 6d. =	0	7	8	0	7	$8\frac{2}{3}$
$\frac{1}{3}$ th barley, $1\frac{1}{10}$ th bushels at 3s. 6d. = 3 $10\frac{1}{3}$ at 4s. 0d. =	0	4	$4\frac{1}{3}$	0	4	$4\frac{1}{3}$
$\frac{2}{3}$ th wheat, $1\frac{1}{6}$ bushels at 6s. 0d. = 7 $8\frac{2}{3}$ at 7s. 0d. =	0	8	$11\frac{1}{3}$	0	8	$11\frac{1}{3}$
	19	3		1	1	1

Allowance to the tenant for manure per acre and per annum on the arable land cropped, being an amount allowed with a view to cancel the tenant's claim for unexhausted improvement in manures, and also with a view to secure to the landlord improved condition of the holding. This allowance, however, being contingent on the proportion of the tenant's expenditure in oil-cakes and artificial manures purchased, and not arising from the produce of the farm ... ..

	1	10
Landlord's rent ... ..	19	3

## ANALYSIS OF THE LANDLORD'S RENT, AS ABOVE.

The farm in question being considered a type of the Wilton House estate (though an inferior one), the following detailed estimate of the landlord's rent is arrived at by applying to it the conditions affecting the property as a whole. Interest upon outlay on following:—

Boundaries, fencing, roads, and water supply ... ..	1	2 $\frac{1}{4}$
Farm homesteading ... ..	8	7 $\frac{1}{2}$
Labourers' cottages ... ..	2	7
<hr/>		
Amount of rent due to landlord as interest on expenditure in carrying out above ... ..	12	14 $\frac{3}{4}$
Balance remaining subject to the following contingencies, viz.:		
Repairs and restorations, drainage, educational purposes, and local subscriptions ... ..	*6	10 $\frac{1}{4}$
	19	3
	<hr/> <hr/>	

The rent of the farm being determined at £300 per annum, but nevertheless subject to an adjustment in conformity to the Earl of Pembroke's principle of letting farms on his Wiltshire estates, which was regulated by the market prices of produce as they arose prior to the abrogation of the Corn Laws, and settled upon the following conditions, viz.:

The fixed or pivot rent in the agreement being £100 gross, or £90 net per annum, or, otherwise, the value of 1,600 lbs. of meat, 114 $\frac{1}{4}$  bushels of barley, and 113 $\frac{1}{3}$  bushels of wheat (subject, however, to an allowance for manure), which quantities respectively are to be converted into money on the average prices of three years, and continued yearly, so as to be always the average of the preceding three years, the meat to be determined by the average prices of beef, mutton, lamb, veal, and pork, in Smithfield, or the returns of the principal market in London as published in the *Mark Lane Express*, and the value per bushel of the barley and wheat to be obtained from the returns which are made for ascertaining the annual value of the tithe rent charges in England and Wales, an allowance to be made annually for manures purchased, and not

\* The balance, 6s. 10 $\frac{1}{4}$ d. (which, out of a rent of 30s. 3d. per acre, equal to little more than 1-5th), is the amount the landlord actually receives as net income from the rental part of his estate. It ought to be remembered that the duties and position of the owner of land requires that he should set aside a part of his income for district and county responsibilities, and that in many cases the amount of interest on capital thus made dormant exceeds by thousands of pounds per annum the rental value of his residence and grounds.

arising from the produce of the farm, this amount not to exceed 10 per cent. of the net annual fixed or pivot rent of £90 per annum. The allowance, however, being contingent on the proportions, varying from one-half to one-third, of the tenant's expenditure in oil-cakes and artificial manures purchased.

The prices which have governed the rental of Wilton House estate from 1850 to 1870 stood thus: Meat, 6½d. per lb.; Barley, 4s. 4d. per bushel; and Wheat, 6s. 6¼d. per bushel.

And the following sections show the range of action during the entire period as regards landlord and tenant:

	Rents.					
	Gross.			Net.		
	£	s.	d.	£	s.	d.
Rent accruing on three years' market averages under } first contract ... ..	111	19	7¾	102	19	7¾

Amount conceded to tenant by abatement in rent of } £9 7s. per cent. on the rents of 1862-3-4 ... ..	2	18	1½	2	18	1½
Amount accruing on three years' averages, standard } 1864 ... ..	106	12	2½	97	12	2½
Amount received by Earl of Pembroke from Michaelmas, } 1852, to Michaelmas, 1872 ... ..	106	3	3½	97	3	3½
Balance in favour of tenant per cent. up to 1873, when } the produce rents were abolished ... ..	0	8	11	0	8	11

In connection with this explanation a remarkable coincidence occurs. The range of prices between 1850 and 1870, and upon which the rents of the estate of which the Wilton House Home Farm is a type were governed were, as has been shown, viz., 6½d. per lb. for meat, 4s. 4d. for barley, and 6s. 6¼d. per bushel for wheat, the balance, with those prices, being in favour of the tenant to the extent of 8s. 11d. per cent. Whilst the estimate of Sir R. Peel's government for the range of prices, on the abrogation of the Corn Laws, was 6d. per lb. for meat, 4s. for barley, and 6s. per bushel for wheat. These were supplied to the Government by the late Lord Herbert of Lea in 1864, and they have been borne out by the results of his Home Farm.

Balance, being loss by Stock, including the amount charged for Hay of home growth, and not included in the Cash Accounts ...	...	...	...	...	...	...	...	...	...	...	...	...	2	18	5 $\frac{1}{2}$			

N.B.—The above statement corroborates previous deductions thus:—

Balance as above, being loss by Stock in the production of meat ... .. 2 18 5 $\frac{1}{2}$

The aggregate loss in converting the Hay, Root, and Green Crops into meat is shown (Fol. 18 of the accounts) to be ... .. 2 18 8

The amount deducted (Fol. 31) as the loss in producing the Hay, Root, and Green Crops before conversion of them into meat is shown to be ... .. 2 5 8 $\frac{3}{4}$

And consequently the loss by Stock is thus corroborated.

ANALYSIS OF THE SOILS OF WILTON HOUSE HOME  
FARM,

By SIR LYON PLAYFAIR, C.B., F.R.S.

MUSEUM ECONOMIC GEOLOGY,

24th August, 1846.

SIR,

I have now the honour to transmit to you the results of my analysis of six specimens of soils sent by you at the request of the Honourable Sidney Herbert.

I will first state the results of the analysis of soils Nos. 1, 2, 4, 5, as these are analogous in properties:—

	I.	II.	IV.	V.
Organic matter ... ..	5·38	7·96	5·7	9·8
Carbonate of lime (chalk ... ..)	42·74	44·79	65·3	60·5
Carbonate of magnesia ... ..	0·57	1·17	2·0	2·3
Phosphate of magnesia ... ..	0·50	0·28	trace	trace
Peroxide of manganese ... ..	0·21	trace	trace	trace
Peroxide of iron ... ..	4·07	3·34	4·1	1·9
Alumina ... ..	4·32	5·33	4·7	3·6
Silica ... ..	42·55	35·84	17·8	20·2
Potash } as silicates in the soils ... ..	0·52	1·58	traces	0·8
Soda } ... ..	0·07	trace	traces	trace
Sulphates and chlorides ... ..	traces	traces	traces	traces
	100·93	100·29	99·6	99·1
Differences from 100 ... ..	93	29	4	9
	100·00	100·00	100·0	100·0

Soils Nos. 3 and 6 are much less calcareous, and are composed as follows:—

	III.	VI.
Organic matter ... ..	16·14	1·3
Silica ... ..	64·12	70·3
Alumina ... ..	8·30	16·9
Peroxide of iron ... ..	3·92	8·7
Protoxide of iron ... ..	1·71	
Peroxide of manganese ... ..	0·20	0·6
Lime } of which only a trace is as chalk, the principal part being } combined with silica ... ..	3·01	0·8
Magnesia ... ..	0·06	0·5
Potash ... ..	2·03	about 0·8
Chloride of sodium (common salt) ... ..	trace	trace
Phosphoric acid ... ..	0·32	trace
	99·81	99·9
Difference from 100 ... ..	0·19	0·1
	100·00	100·00

The first point which characterises all these soils is their deficiency in sulphates, and perhaps also in common salt, although the latter is present in larger traces than the former. Sulphates are absolutely essential to the growth of cereal crops, and may be supplied as a manure either in the form of gypsum, of glauber salts (sulphate of soda) or in guano. If gypsum can easily be obtained in your locality it might be advantageously tried.

No. I. contains in tolerable abundance all the constituents essential to fertility except sulphates and common salt. You will know by practical experience whether there be sufficient alumina (clay) to give proper tenacity to the soil.

No. II. is deficient in soda, which might be supplied by salt or sulphate of soda, as the sulphates are deficient. The phosphoric acid is present in very small quantity, and ought to be supplied copiously, either in the form of stable manure, bone earth, or guano, as best suits the physical condition of the soil.

No. III. is deficient in magnesia, and also in lime. The magnesia is often advantageously added by throwing a small quantity of sulphate of magnesia (Epsom salts) into the stable, night-soil, or other manures used. This saline manure has been used in Yorkshire under similar circumstances with success. A limestone containing several per cent. of magnesia would, however, be a safer addition, and attended with less trouble, as both lime and magnesia are required. The soil requires good working, as it contains so much organic matter as to reduce the peroxide of iron (iron rust) into the protoxide of iron, which is highly poisonous to plants. Good working and exposure to air is the only means of overcoming this evil.

No. IV. is not calculated at present for the crops containing alkalis without the copious use of manures containing these ingredients. Both the potash and soda are very deficient. They may be supplied in wood ashes, the nitrates of potash and soda, stable manure, guano, &c., or with the addition of some of the first to the latter manures. This soil is also very deficient in phosphates.

No. V. I understand to be the upper soil, and No. VI. to be the subsoil of the same field. The upper soil is very deficient in alumina, which trenching the subsoil would supply. One precaution should, however, be observed. The subsoil contains a considerable quantity of iron, which in the specimen sent to me is principally in the favourable state for trenchploughing (as peroxide), but as this might have changed by exposure to the air, I wish you would send me by post a small quantity—

an ounce or two would be sufficient—to examine this again in a *freshly* excavated specimen. Liming would aid the passage of the lower into the higher oxide. Phosphates are wanting in Nos. V. and VI., and are especially necessary for garden allotments. The addition of this in manure is easy, and the allottees should be told that the saving and application of their liquid manure and night-soil to this land would be especially beneficial. Soda salts are also wanting, and should be supplied in the manure. Even if trench-ploughing does not succeed at first, I have little doubt of its doing so in a very short time from the decomposing powers of the chalk in the upper soil upon the undisintegrated parts of the sub-soil.

I shall be delighted to give you any further information in my power, or to furnish any explanations which you may desire, and I have the honour to be,

Your faithful servant,

LYON PLAYFAIR.

W. ROBSON, Esq.

KEY TO CALCULATIONS SHOWING DETAILS OF ESTIMATED  
GAME DAMAGES.

£50 per annum divided, viz. :— $\frac{4}{9}$  Cereals, and  $\frac{5}{9}$  Hay, Root, and Green Crops.

	£	s.	d.
$\frac{4}{9}$ of £50	= 22	4	$5\frac{1}{3}$
$\frac{5}{9}$ of £50	= 27	15	$6\frac{2}{3}$
	<u>£50</u>	<u>0</u>	<u>0</u>

	Acre s.	£	s.	d.	£	s.	d.
Wheat	= 26 $\frac{2}{3}$	of 22	4	$5\frac{3}{4}$	= 6	12	$9\frac{1}{3}$
Barley	= 26 $\frac{2}{3}$	of 22	4	$5\frac{3}{4}$	= 6	12	$9\frac{3}{4}$
Oats	= 25 $\frac{2}{3}$	of 22	4	$5\frac{3}{4}$	= 6	7	$7\frac{1}{4}$
Beans	= 10 $\frac{1}{3}$	of 22	4	$5\frac{3}{4}$	= 2	11	$0\frac{1}{2}$
	<u>87</u>				<u>£22</u>	<u>4</u>	<u><math>3\frac{1}{3}</math></u>

$18\frac{1}{2}$  at 7s. 0 $\frac{1}{4}$ d. = £6 9 10 $\frac{1}{2}$

$28\frac{3}{4}$  at 4s. 7 $\frac{1}{4}$ d. = £6 12 4 $\frac{1}{4}$

39 at 3s. 3 $\frac{1}{4}$ d. = £6 7 6 $\frac{3}{4}$

9 at 5s. 6 $\frac{1}{2}$ d. = £2 9 10 $\frac{1}{2}$

£21 19 8

or 4s. 11 $\frac{1}{2}$ d. per acre.

WHEAT.—If 7s. 0 $\frac{1}{4}$ d. give 1 bushel, what will £6 12s. 9 $\frac{1}{2}$ d. give =  $18\frac{1}{2}$  or nearly  $\frac{2}{3}$  bushel per acre.

BARLEY.—If 4s. 7 $\frac{1}{4}$ d. give 1 bushel, how many will £6 12s. 9 $\frac{3}{4}$ d. give =  $28\frac{3}{4}$  bush., or nearly  $1\frac{1}{3}$  bush. per acre.

OATS.—If 3s. 3 $\frac{1}{4}$ d. give 1 bushel, how many bushels will £6 7s. 7 $\frac{1}{4}$ d. give = 39, or nearly  $1\frac{1}{2}$  per acre.

BEANS.—If 5s. 6 $\frac{1}{2}$ d. give 1 bushel, what will £2 11s. 0 $\frac{1}{2}$ d. give = 9, or nearly  $\frac{1}{3}$  bushel per acre.

			£	s.	d.	£	s.	d.
Mutton	... 17,137	$\frac{17137}{35094}$	of 27	15	$6\frac{2}{3}$	= 13	11	$3\frac{1}{4}$
Beef	... 8,293	$\frac{8293}{35094}$	of 27	15	$6\frac{2}{3}$	= 6	11	$3\frac{1}{4}$
Swine	... 7,656	$\frac{7656}{35094}$	of 27	15	$6\frac{2}{3}$	= 6	1	$2\frac{1}{4}$
Poultry	... 589 $\frac{1}{8}$	$\frac{589\frac{1}{8}}{35094}$	of 27	15	$6\frac{2}{3}$	= 0	9	$3\frac{3}{4}$
Wool	... 1,419 $\frac{3}{10}$	$\frac{1419\frac{3}{10}}{35094}$	of 27	15	$6\frac{2}{3}$	= 1	2	$5\frac{1}{2}$
	<u>35,094<math>\frac{17}{10}</math></u>					<u>£27</u>	<u>15</u>	<u>6</u>

These results respectively show the loss occasioned by Game in the production of Meat, the £27 15s. 6d. being 5s. 0 $\frac{1}{2}$ d. per acre.
